

What to expect? Radiesse Injection

- RADIESSE is a dermal filler that is injected into the skin to soften creases or folds, support areas of volume loss or contour specific facial areas
- Local numbing medication may be used to maximize your comfort during the procedure. Most patients report a mild discomfort typically associated with needle injections
- You may experience a mild to moderate amount of stinging or aching sensation post injection
- To ensure even correction the physician will massage the area treated, which may cause a temporary, minimal to moderate amount of redness to your skin
- Bruising at the site of injection is a commonly reported side effect. To minimize bruising, inform your provider if you use blood thinners such as ibuprofen, aspirin, or herbal preparations prior to your procedure
- Temporary minimal to moderate swelling can be expected, which should dissipate following injection. Some patients report dramatic reduction in swelling hours after their treatment
- It is normal to experience some tenderness at the treatment site for a few days
